

## OpenGL Texture Mapping

---

### Objectives

- Introduce the OpenGL texture functions and options

1

## Basic Strategy

---

### Three steps to applying a texture

#### 1. Specify the texture

- Read or generate image
- Assign to texture
- Enable texturing

#### 2. Assign texture coordinates to vertices

- Proper mapping function is left to application

#### 3. Specify texture parameters

- Wrapping, filtering

2

## Texture Mapping

---

3

## Texture Example

---

The texture (below) is a 256 x 256 image that has been mapped to a rectangular polygon which is viewed in perspective

4

## Texture Mapping and the OpenGL Pipeline

---

- Images and geometry flow through separate pipelines that join at the rasterizer
  - “complex” textures do not affect geometric complexity

5

## Specify Texture Image

---

- Define a texture image from an array of *texels* (texture elements) in CPU memory
  - Glubyte my\_texels[512][512];
- Define as any other pixel map
  - Scanned image
  - Generate by application code
- Enable texture mapping
  - glEnable(GL\_TEXTURE\_2D)
  - OpenGL supports 1-4 dimensional texture maps

6

## Define Image as a Texture

---

- **glTexImage2D( target, level, components, w, h, border, format, type, texels );**
  - target:** type of texture, e.g. GL\_TEXTURE\_2D
  - level:** used for mipmapping (discussed later)
  - components:** elements per texel
  - w, h:** width and height of **texels** in pixels
  - border:** used for smoothing (discussed later)
  - format and type:** describe texels
  - texels:** pointer to texel array
- **glTexImage2D(GL\_TEXTURE\_2D, 0, 3, 512, 512, 0, GL\_RGB, GL\_UNSIGNED\_BYTE, my\_texels);**

7

## Converting A Texture Image

---

- OpenGL requires texture dimensions to be powers of 2
- If dimensions of image are not powers of 2
  - gluScaleImage( format, w\_in, h\_in, type\_in, \*data\_in, w\_out, h\_out, type\_out, \*data\_out );**
    - **data\_in** is source image
    - **data\_out** is for destination image
- Image interpolated and filtered during scaling

8

## Mapping a Texture

- Based on parametric texture coordinates
- `glTexCoord*()` specified at each vertex

## Typical Code

```
glBegin(GL_POLYGON);
glColor3f(r0, g0, b0);
glNormal3f(u0, v0, w0);
glTexCoord2f(s0, t0);
glVertex3f(x0, y0, z0);
glColor3f(r1, g1, b1);
glNormal3f(u1, v1, w1);
glTexCoord2f(s1, t1);
glVertex3f(x1, y1, z1);
```

....

```
glEnd();
```

- Note that we can use vertex arrays to increase efficiency

10

## Interpolation

- OpenGL uses bilinear interpolation to find proper texels from specified texture coordinates
- Can be distortions

## Texture Parameters

### OpenGL has a variety of parameters that determine how texture is applied

- Wrapping parameters determine what happens if  $s$  and  $t$  are outside the  $(0,1)$  range
- Filter modes allow us to use area averaging instead of point samples
- Mipmapping allows us to use textures at multiple resolutions
- Environment parameters determine how texture mapping interacts with shading
- Allows use of the same pipeline for all views

12

## Wrapping Mode

- **Clamping:** if  $s, t > 1$  use 1, if  $s, t < 0$  use 0
- **Wrapping:** use  $s, t$  modulo 1
- `glTexParameteri( GL_TEXTURE_2D, GL_TEXTURE_WRAP_S, GL_CLAMP )`
- `glTexParameteri( GL_TEXTURE_2D, GL_TEXTURE_WRAP_T, GL_REPEAT )`

13

## Magnification and Minification

- pixel can cover a texel (*magnification*) More than one texel can cover a pixel (*minification*) or more than one
- Can use point sampling (nearest texel) or linear filtering (  $2 \times 2$  filter) to obtain texture values

14

## Filter Modes

- Modes determined by  
- `glTexParameteri( target, type, mode )`

- `glTexParameteri( GL_TEXTURE_2D, GL_TEXTURE_MAG_FILTER, GL_NEAREST );`
- `glTexParameteri( GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER, GL_LINEAR );`

Note that linear filtering requires a border of an extra texel for filtering at edges (border = 1)

15

## Mipmapped Textures

- *Mipmapping* allows for prefiltered texture maps of decreasing resolutions
- Lessens interpolation errors for smaller textured objects
- Declare mipmap level during texture definition  
`glTexImage2D( GL_TEXTURE_*D, level, ... )`
- GLU mipmap builder routines will build all the textures from a given image  
`gluBuild*DMipmaps( ... )`

16

## Example

---

17

## Texture Functions

---

- **Controls how texture is applied**
  - `glTexEnv{fi}v(GL_TEXTURE_ENV, prop, param )`
- **GL\_TEXTURE\_ENV\_MODE modes**
  - `GL_MODULATE`: modulates with computed shade
  - `GL_BLEND`: blends with an environmental color
  - `GL_REPLACE`: use only texture color
  - `GL(GL_TEXTURE_ENV, GL_TEXTURE_ENV_MODE, GL_MODULATE);`
- Set blend color with `GL_TEXTURE_ENV_COLOR`

18

## Perspective Correction Hint

---

- **Texture coordinate and color interpolation**
  - either linearly in screen space
  - or using depth/perspective values (slower)
- **Noticeable for polygons “on edge”**  
`glHint( GL_PERSPECTIVE_CORRECTION_HINT, hint)`  
where `hint` is one of
  - `GL_DONT_CARE`
  - `GL_NICEST`
  - `GL_FASTEST`

19

## Generating Texture Coordinates

---

- **OpenGL can generate texture coordinates automatically**
  - `glTexGen {ifd} [v] ()`
- **Specify a plane**
  - generate texture coordinates based upon distance from the plane
- **Generation modes**
  - `GL_OBJECT_LINEAR`
  - `GL_EYE_LINEAR`
  - `GL_SPHERE_MAP` (used for environmental maps)

20

## Texture Objects

---

- **Texture is part of the OpenGL state**
  - If we have different textures for different objects,
- **OpenGL will be moving large amounts data from processor memory to texture memory**
  - Recent versions of OpenGL have *texture objects*
  - one image per texture object
  - Texture memory can hold multiple texture objects

21

## Applying Textures II

---

1. specify textures in texture objects
2. set texture filter
3. set texture function
4. set texture wrap mode
5. set optional perspective correction hint
6. bind texture object
7. enable texturing
8. supply texture coordinates for vertex
  - coordinates can also be generated

22

## Other Texture Features

---

- **Environmental Maps**
  - Start with image of environment through a wide angle lens
    - Can be either a real scanned image or an image created in OpenGL
  - Use this texture to generate a spherical map
  - Use automatic texture coordinate generation
- **Multitexturing**
  - Apply a sequence of textures through cascaded texture units

23

## Generating Texture Coordinates

---

- **OpenGL can generate texture coordinates automatically**
  - `glTexGen {ifd} [v] ()`
- **Specify a plane**
  - generate texture coordinates based upon distance from the plane
- **Generation modes**
  - `GL_OBJECT_LINEAR`
  - `GL_EYE_LINEAR`
  - `GL_SPHERE_MAP` (used for environmental maps)
